

RDP: Connecting from Linux to Windows using Remmina

Assignment study PDF — English

1. What is RDP?

Remote Desktop Protocol (RDP) is a protocol used to access and control a remote graphical desktop. In this assignment, Linux acts as the client and Windows acts as the RDP server.

2. What is Remmina?

Remmina is a Linux remote-desktop client supporting protocols including RDP and VNC. Ubuntu documentation recommends Remmina for accessing remote desktops.

3. Basic setup

On Ubuntu, Remmina can be installed with: `sudo apt install remmina remmina-plugin-rdp remmina-plugin-vnc`. On Windows, Remote Desktop must be enabled and the Windows edition must support incoming RDP connections.

4. Connection procedure

1) Find the Windows IP address using `ipconfig`. 2) Enable Remote Desktop on Windows. 3) Install and open Remmina on Linux. 4) Create a new profile. 5) Select RDP. 6) Enter the Windows IP address, username and password. 7) Save and connect.

5. Important port

RDP normally uses TCP port 3389. A firewall must permit the connection when the machines are communicating across a network.

6. Troubleshooting

Check that both machines can reach each other, the Windows Remote Desktop service is enabled, the username/password are correct, the RDP port is reachable, and the Windows firewall permits Remote Desktop.

7. Practical commands

```
ip addr
```

```
ping WINDOWS_IP
```

```
sudo apt install remmina remmina-plugin-rdp
```
